

Fake Job Posting Detection using ANN

What is this project?

I built a model that reads job postings and detects if the job is real or fake to help people avoid scams.

Type of Problem: Binary Classification (Real or Fake)

Algorithm Used: ANN — Artificial Neural Network

Tools and Libraries: Python, TensorFlow, Keras, Pandas, Scikit-learn, NLP tools

Steps I followed:

1. Loaded the fake job postings dataset
2. Cleaned and processed the text data
3. Converted text to numbers using text vectorization
4. Built a neural network
5. Trained and tested the model
6. Checked precision, recall, and accuracy

What I learned: How to work with text data and use neural networks for detecting fraud/fake content.
